Click on any blue, underlined text to go to its linked reference.

When you have a CD full of mp3 music, you're going to want to play it.
MP3 is an acronym of MPEG-1 or MPEG-2 audio layer 3. It is a compressed audio format that still allows a relatively high sound quality while reducing the file size. A compression rate of 12:1 is possible through MP3.
This is how to do it.

Figure 1

1. When the CD is inserted and recognized, you'll get an AutoPlay window. Click on "Open folder to view files" — the last choice (**Figure 1**).

2. When the files are shown (**Figure 2**):
❶ Left-click on any file.
❷ Use the Ctrl + A keys to select all files.

Figure 2

3. Play the music:
❶ **RIGHT**-click on the selected area.
❷ Left-click on "Play" in the popup window
(**Figure 3**).

Figure 3

4. Use the Player (**Figure 4**):
❶ All songs and playing times appear.
❷ You can expand the file list by moving your
cursor to the vertical line between the graphic and the list. Left-clicking, hold,
and drag the vertical line to the left.
❸ To play any song not being played, double-left-click on that song.
❹ Left-click on the Pause button to pause.
❺ Left-click on the "X" to exit.
